

Our 21st Century Solution

for microbes, odors and VOCs in the air and on surfaces

At EMT it's not enough to simply tell you that you have a problem or to only offer a temporary fix for environmental pathogens. That is why we have developed the **4-Step Total Solution** that provides the assurance that hazards are prevented, even during processing, significantly reducing risk.

1. Quantify & Identify

With our Bactiscan lamp we identify the location of contaminants (Bio films, molds, bacteria and many other contaminants) on solid surfaces using no consumables. We also use our the BAMS (BioAerosol Monitoring System) unit to measure total pathogens found in the air that are both viable and nonviable. BAMS tells us the size & quantity of the living airborne particulates.

2. Combat & Reduce

We clean the environment with our proprietary MAK units, providing validated results without production down time. This stabilizes the area & reduces the risk of having contaminated product.

3. Actively Prevent

We install our purification devices throughout the affected areas either as stand alone hardware or deployed via a building's HVAC systems. This provides 24 hour a day, 7 days a week preventative measure (per FSMA) reducing the risks of associated with listeria, E. coli, salmonella & molds etc..

4. Monitor & Maintain

We provide peace of mind with periodic measurements & ongoing documentation of the environmental status. This allows our customers to see where they stand in real time. Our equipment is inspected & maintained on a semi-annual basis, replacing the proprietary cells every 24 months.
